## Preparedness Network

Real-time  
Collaboration  
Communication  
and  
Exchange of  
Information in  
the Management  
Both of Routine  
Incidents and  
Large-Scale  
Emergency  
Operations

- **Avoid emergencies by pro-actively handling situations**
- **Manage developing situations to reduce the level of the emergency**
- **React quickly and efficiently to mitigate damage of unavoidable situations**

InterLink's Preparedness Network dramatically improves situational awareness and the ability to respond to emergencies by enabling radios of all types and frequencies including through-the-earth technology, video, cell and landline telephone, texts, and data to be combined on a single platform and shared on a real-time, dynamic incident basis. The solution is user friendly, easy to deployment, low-cost, and has full-featured capabilities.

**Improved communication among first responders, military, and vital local resources in the case of an incident saves time, money, and, most importantly, lives. The solution provides more than just voice interoperability to better achieve these goals:**

- **Multi-media Interoperability - all radios, video, phones, and intercoms, as well as texting and file sharing**
- **Real Time Collaboration among Individuals and Agencies: hear, see, and read details**
- **Instant Sharing of Streaming Video – anywhere**
- **Constant Communication among all parties, even in route**
- **Management of Routine Operations or Emergencies, any Scale, any Scope**
- **Virtualization of Emergency Operations - anywhere an IP connection is available**

InterLink greatly improves communications for anyone who handles emergencies or who may have an emergency. Using innovative technology for the secure transmission of voice communications, video, data, and text over public IP networks (Internet), the solution incorporates unprecedented interoperability to create a "virtual workspace," which can be extended to include all key resources.

A communications network is rapidly established and modified based on the need, stage, and condition of each incident. InterLink users have access to their own people, to other agencies, to all key personnel, and to the external public and private resources needed to handle an incident of any magnitude, while maintaining complete control over all information being exchanged.

## A revolutionary approach provides interoperability among Radios, Video, Telephones, Text, and More:

- **Radios:** All makes, all frequencies currently sold in the US, send and receive
- **Telephones:** Land lines, cell phones, Wi-Fi, and VoIP
- **Archives, Files and Images:** Architectural drawings, maps, photos, Hazmat data, etc.
- **Video Surveillance Systems:** Live images from all sources, including airborne, send and receive
- **Text Messaging:** More effective communication for essential information, all sources
- **Public Address Systems:** Speak directly over remote PA systems
- **Portable Interactive Consoles:** Unparalleled onsite or remote mobility for command and control.

## Controllable, Intuitive, Affordable

**Controllable:** Users have complete control over when, by what method, and with whom they communicate; they can accept or reject invitations and exit incidents at their discretion. This level of control ensures first responders are receptive to other parties being on the network.

**Intuitive:** Resources can be quickly added via Drag and Drop with simple keyboard input. All resources are displayed for instant interaction. Any computer user becomes a capable operator within a matter of minutes.

**Affordable:** Users leverage their existing equipment in cooperation with the system. In addition, each user purchases only the components they require and there is no central server to buy. Each workstation has all the power any user needs to access all network resources.
